

MASTERING ABSTRAX DOSING A GUIDE TO PRECISION

WE STRONGLY ADVISE THE USE OF A HIGH ACCURACY PIPETTE FOR THE BENCH TOP TRIALS

Application: It is recommended to add the product inline either during transfer to the brite tank or directly into it. This enables precise flavour control in the final beer, eliminating the risk of aromatic compound loss during fermentation & conditioning.

1

Measuring

Measure 1,000ml (1l)
of sparkling water
or non-dry hopped beer.

2

Dosing

Dose into the water/beer

Quantum Brite and BrewGas
dosing should be 0.1ml/litre.

Skyfarm is 0.05ml/litre
OR it is 0.1ml/2 litre

Gradual additions after the initial dose will help to
determine the appropriate level of dosing.

3

Mixing

Make sure to stir or rouse
the dosed product to ensure
complete homogenisation of
the product into the liquid.

4

Tasting

Complete a sensory evaluation
by pouring the mixed liquid into
a clean glass.

Aroma and flavour should be
noticeable even at the lowest end
of dosing.

**CHARLES
FARAM**

1865

Dosing can be repeated up
to a total of

0.5ml/litre 0.3ml/litre

Quantum Brite
and BrewGas

SkyFarm.
